Reflection

I think the class selector was the most useful selector in this assignment because I could use the same style on multiple parts of my website. For example, I used the ".card" class to give the sections the same spacing and borders without writing different rules for each one.

I learned that margin creates space outside of an element's border, and padding creates space between the content and the border. I used the margin to separate the sections and the padding to keep the text from being too close to the edge. The box model helped me understand how content, padding, borders, and margins work with each other.

One situation where a rule overrode another was with the ".note" class. My paragraph rule was set to a certain color, but paragraphs using ".note" used that class color instead of the preset rule. This is because class selectors are more specific than element selectors, so they have more priority.

The spacing changes improved my website the most. It makes my site look more organized and accessible.
